

COVID-19 and violence against women

What the health sector/system can do

7 April 2020

Violence against women remains a major threat to global public health and women's health during emergencies

- Violence against women is highly prevalent. Intimate partner violence is the most common form of violence.
 - Globally, 1 in 3 women worldwide have experienced physical and/or sexual violence by an intimate partner or sexual violence by any perpetrator in their lifetime. Most of this is intimate partner violence.
- Violence against women tends to increase during every type of emergency, including epidemics. Older women and women with disabilities are likely to have additional risks and needs. Women who are displaced, refugees, and living in conflict-affected areas are particularly vulnerable.
- Although data are scarce, reports from China, the United Kingdom, the United States, and other countries suggest an increase in domestic violence cases since the COVID-19 outbreak began.^{1,2}
 - The number of domestic violence cases reported to a police station in Jingzhou, a city in Hubei Province, tripled in February 2020, compared with the same period the previous year.³
- The health impacts of violence, particularly intimate partner/domestic violence, on women and their children, are significant. Violence against women can result in injuries and serious physical, mental, sexual and reproductive health problems, including sexually transmitted infections, HIV, and unplanned pregnancies.

How COVID-19 can exacerbate risks of violence for women

- Stress, the disruption of social and protective networks, and decreased access to services can all exacerbate the risk of violence for women.
- As distancing measures are put in place and people are encouraged to stay at home, the risk of intimate partner violence is likely to increase. For example:
 - The likelihood that women in an abusive relationship and their children will be exposed to violence is dramatically increased, as family members spend more time in close contact and families cope with additional stress and potential economic or job losses.
 - Women may have less contact with family and friends who may provide support and protection from violence.
 - Women bear the brunt of increased care work during this pandemic. School closures further exacerbate this burden and place more stress on them.
 - The disruption of livelihoods and ability to earn a living, including for women (many of whom are informal wage workers), will decrease access to basic needs and services, increasing stress on families, with the potential to exacerbate conflicts and violence. As resources become scarcer, women may be at greater risk for experiencing economic abuse.⁴
 - Perpetrators of abuse may use restrictions due to COVID-19 to exercise power and control over their partners to further reduce access to services, help, and psychosocial support from both formal and informal networks.
 - Perpetrators may also restrict access to necessary items such as soap and hand sanitizer.⁵
 - Perpetrators may exert control by spreading misinformation about the disease and stigmatize partners.⁵
- Access to vital sexual and reproductive health services, including for women subjected to violence, will likely become more limited.
- Other services, such as hotlines, crisis centers, shelters, legal aid, and protection services may also be scaled back, further reducing access to the few sources of help that women in abusive relationships might have.

The risks of violence that women and their children face during the current COVID-19 crisis cannot be ignored.

Health systems have an important role in ensuring that services for women who have experienced violence remain accessible during the COVID-19 outbreak

Although COVID-19 has placed an immense burden on the health systems and health workers in caring for the sick, there are things that can help mitigate the impacts of violence on women and children during this time:

- All stakeholders involved in the COVID-19 response need to raise awareness of the potential effects that physical distancing, stay at home and other measures are likely to have on women who are subjected to violence and their children.
- Health workers, the majority of whom are women in many settings, may be at risk for violence in their homes or in the workplace. The latter is a serious problem that may be exacerbated when health systems are under stress. Health managers or facility administrators need to have plans to address the safety of their health workers. Front-line providers dealing with COVID-19 might experience stigmatization, isolation, and being socially ostracized. Provisions for psychosocial support, non-performance-based incentives, additional transport allowance, and child-care support should be planned.⁶

What can be done to address violence against women during the COVID-19 response

Although the COVID-19 pandemic has placed an immense burden on health systems, including frontline health workers, there are things that can help mitigate the effects of violence on women and children.

Governments and policy makers must include essential services to address violence against women in preparedness and response plans for COVID-19, fund them, and identify ways to make them accessible in the context of physical distancing measures.

Health facilities should identify and provide information about services available locally (e.g. hotlines, shelters, rape crisis centers, counselling) for survivors, including opening hours, contact details, and whether services can be offered remotely, and establish referral linkages.

Health providers need to be aware of the risks and health consequences of violence against women. They can help women who disclose by offering first-line support and medical treatment. First-line support includes: listening empathetically and without judgment, inquiring about needs and concerns, validating survivors' experiences and feelings, enhancing safety, and connecting survivors to support services. The use of mHealth and telemedicine in safely addressing violence against women must urgently be explored.

Humanitarian response organizations need to include services for women subjected to violence and their children in their COVID-19 response plans and gather data on reported cases of violence against women.

Community members should be made aware of the increased risk of violence against women during this pandemic and the need to keep in touch and support women subjected to violence, and to have information about where help for survivors is available. It is important to ensure that it is safe to connect with women when the abuser is present in the home.

Women who are experiencing violence may find it helpful to reach out to supportive family and friends, seek support from a hotline, or seek out local services for survivors. They may also find it useful to have a safety plan in case the violence escalates. This includes having a neighbor, friend, relative, or shelter identified to go to should they need to leave the house immediately for safety.

Tips for coping with stress at home and actions to take if you or your family members are experiencing violence:

- Be aware that social isolation, quarantine, and distancing can affect you and your family's psychological well-being.
- As much as possible, reduce sources of stress by:
 - Seeking information from reliable sources and reducing the time spent consuming news (1-2 times per day, rather than every hour).
 - Seeking support from family and friends via phone, email, text, etc.
 - Trying to maintain daily routines and make time for physical activity and sleep.
 - Using relaxation exercises (e.g. slow breathing, meditation, progressive muscle relaxation, grounding exercises) to relieve stressful thoughts and feelings.
 - Engaging in activities that in the past have helped with managing adversity.
- Women who are experiencing violence may find it helpful:
 - To reach out to supportive family and friends who can help practically (e.g. food, child care) as well as in coping with stress.
 - To develop a safety plan for their and their children's safety in case the violence gets worse. This includes keeping numbers of neighbors, friends, and family whom you can call for or go to for help; have accessible important documents, money, a few personal things to take with you if you need to leave immediately; and plan how you might leave the house and get help (e.g. transport, location).
 - To keep information on violence against women hotlines, social workers, child protection or nearest police station, and accessible shelters and support services. Be discreet so that your partner or family members do not find this information.
